Abstract

In this thesis we use the means of super-symmetric quantum mechanics to study of the Spin-weighted Spheroidal Wave in the case of s=3/2. We obtain some interesting results: the first-five terms of the super-potential, the general form of the super-potential. The ground eigen-function and eigenvalue of the equation are also given. According these results?we make use of the shape invariance property to compute the exited eigenvalues and eigen-functions. These results help us to understand the Spin-weighted Spheroidal Wave and show that it is integral.

PACS:11.30Pb; 04.25Nx; 04.70-s

1 Introduction

The spin-weighted spheroidal functions first appeared in the study of the stable problem of Kerr black hole. Now, the spin-weighted spheroidal functions has been widely used in many fields, such as gravitational wave detection, quantum filed theory in curved space-time,black hole stable problem;nuclear modeling; spheroidal cavity problem, spheroidal electromagnetic diffraction,scattering and similar problems in acoustic science,etc. Their equation is

$$\left[\frac{1}{\sin\theta}\frac{d}{d\theta}\left(\sin\theta\frac{d}{d\theta}\right)+s+\beta^2\cos^2\theta-2\beta\cos\theta-\frac{(m+s\cos\theta)^2}{\sin^2\theta}+\lambda\right]\Theta(\theta)=0, \quad (1)$$

The parameter s, the spin-weight of the perturbation fields could be $s = 0, \pm\frac{1}{2}, \pm\frac{3}{2}, \pm1, \pm2$, and corresponds to the scalar, neutrino, Rarita-schwinger fields, electromagnetic or gravitational perturbations respectively.When $\beta = 0$ they reduce to the spin-weighted spherical equations,whose solutions are the well-known the spin-weighted spherical harmonics. Furthermore, when $\beta = s = 0$, they become to the spherical ones, whose solutions are the famous associated Legendre's functions P_l^m. However when $\beta \neq 0$ and $s \neq 0$, the solutions are the spin-weighted spheroidal functions, which are treated recently by a new method in supersymmetry quantum mechanics. Some nice results are obtained in the case of $s = 0$ and $s = \frac{1}{2}$. Now we continue this study in the case of $\frac{3}{2}$. Though the method is somehow identical, the computation involved becomes more complex than before. The course of our calculations could provide useful information for studying them in the case of $s = 1$ and $s = 2$.

2 Calculation of super-potential and ground eigenvalue

The boundary conditions for Eq.(1) requires Θ is finite at $\theta = 0,\ \pi$, this is kind of the Sturm-liuvelle problem. As done before, Eq.(1) is transformed in the Schrödinger form for the use of the method of supersymmetry quantum mechanics. Changing the eigenfunction Θ by

$$\Theta(\theta) = \frac{\Psi(\theta)}{\sqrt{sin\theta}}, \tag{2}$$

the differential equations for the new depend functions Ψ become

$$\frac{d^2\Psi}{d\theta^2} + \left[\frac{1}{4} + s + \beta^2\cos^2\theta - 2s\beta\cos\theta - \frac{(m + s\cos\theta)^2 - \frac{1}{4}}{\sin^2\theta} + E\right]\Psi = 0. \tag{3}$$

The corresponding boundary conditions now turn out as $\Psi|_{\theta=0} = \Psi|_{\theta=\pi} = 0$. The potential in Eq.(3) is

$$V(\theta, \beta, s) = -\left[\frac{1}{4} + s + \beta^2\cos^2\theta - 2s\beta\cos\theta - \frac{(m + s\cos\theta)^2 - \frac{1}{4}}{\sin^2\theta}\right], \tag{4}$$

Now we will introduce SUSYQM to our problem. According to the theory of the $SUSYQM$, the form of ground eigenfunction Ψ_0 is completely known through the super-potential W by the formula

$$\Psi_0 \ = \ N\exp\left[-\int W d\theta\right]. \tag{5}$$

The problem is transformed into solving the super potential W. The super potential W is a most important notion in SUSYQM, and it is determined by the $V(\theta, \beta, s)$ through the Reccita's equation

$$W^2 - W' = V(\theta, \beta, s) - E_0. \tag{6}$$

SO, the key work is to solve Eq.(6). As done before, by expanding the super-potential W and the ground eigenvalue E_0 into series form of the parameter β:

$$W = \sum_{n=0}^{\infty}\beta^n W_n \tag{7}$$

$$E_0 = \sum_{n=0}^{\infty} E_{0,n;m}\beta^n, \tag{8}$$

we solve Eq.(6). The results are:

$$W_0' - W_0^2 = E_{0,0;m} + \frac{3}{2} + \frac{1}{4} - \frac{(m + \frac{3}{2}\cos\theta)^2 - \frac{1}{4}}{\sin^2\theta} \equiv f_0(\theta) \tag{9}$$

$$W_1' - 2W_0W_1 = E_{0,1;m} - 3\cos\theta \equiv f_1(\theta) \tag{10}$$

$$W_2' - 2W_0W_2 = E_{0,2;m} + \cos^2\theta + W_1^2 \equiv f_2(\theta) \tag{11}$$

$$W_n' - 2W_0W_n = E_{0,n;m} + \sum_{k=1}^{n-1} W_kW_{n-k} \equiv f_n(\theta)(n \geq 3) \tag{12}$$

The solution of Eq.(9) is easy to find

$$\begin{aligned} E_{0,0;m} &= m^2+m-15/4 \\ W_0 &= -\frac{3/2+(m+\frac{1}{2})\cos\theta}{sin\theta} \end{aligned} \tag{13}$$

With W_0 known, it is easy to give W_n on according to the knowledge of differential equations,

$$W_n(\theta) = e^{2\int W_0 d\theta} A_n(\theta) = \Big[\tan\frac{\theta}{2}\sin^{2m+1}\theta\Big]^{-3} A_n(\theta) \tag{14}$$

where,

$$\begin{aligned} A_n(\theta) &= \int f_n(\theta) e^{-2\int W_0 d\theta} d\theta \\ &= \int f_n(\theta)\Big[\tan\frac{\theta}{2}\sin^{2m+1}\theta\Big]^3 d\theta \\ &= \int f_n(\theta)(1-cos\theta)^3 sin^{2m-2}\theta d\theta. \end{aligned} \tag{15}$$

Because there appears the cubic power or inverse cubic powers $\tan\frac{\theta}{2}=\frac{1-\cos\theta}{\sin\theta}=\frac{\sin\theta}{1+\cos\theta}$ terms in Eqs.(14),(15), the subsequent calculation becomes more complicated than before (that is, the cases of s=0 and s=1/2). We put it in appendix A. the obtained results are

$$\begin{aligned} E_{0,1;m} &= -\frac{9}{2m+2} \\ E_{0,2;m} &= -\frac{8m^3+96m^2+168m-1}{(2m+2)^3(2m+3)} \\ E_{0,3;m} &= -\frac{36(2m-1)^2(2m+5)^2}{(2m+2)^5(2m+3)(2m+4)} \end{aligned} \tag{16}$$

$$E_{0,4;m} = -\frac{4(2m-1)^2(2m+5)(16m^5+672m^4+3320m^3+2416m^2-6975m-7942)}{(2m+2)^7(2m+4)^2(2m+3)^3} \tag{17}$$

$$W_1(\theta) = a_{1,1}\sin\theta \tag{18}$$

$$W_2(\theta) = b_{2,1}sin\theta + a_{2,1}sin\theta\cos\theta \tag{19}$$

$$W_3(\theta) = b_{3,1}\sin\theta + b_{3,2}\sin^3\theta + a_{3,1}\sin\theta\cos\theta \tag{20}$$

$$W_4(\theta) = b_{4,1}\sin\theta + b_{4,1}\sin^3\theta + a_{4,1}\sin\theta\cos\theta + a_{4,2}\sin^3\theta\cos\theta \tag{21}$$

Where,

$$a_{1,1} = -\frac{3}{2m+2} \tag{22}$$

$$b_{2,1} = -\frac{3(2m-1)(2m+5)}{(2m+2)^3(2m+3)}, \tag{23}$$

$$a_{2,1} = \frac{(2m-1)(2m+5)}{(2m+2)^2(2m+3)} \tag{24}$$

$$b_{3,1} = \frac{108(2m-1)(2m+5)}{(2m+2)^5(2m+3)(2m+4)}, \tag{25}$$

$$b_{3,2} = \frac{6(2m-1)(2m+5)}{(2m+2)^3(2m+3)(2m+4)} \tag{26}$$

$$a_{3,1} = -\frac{36(2m-1)(2m+5)}{(2m+2)^4(2m+3)(2m+4)} \tag{27}$$

$$b_{4,1} = \frac{36(2m-1)(16m^5+672m^4+3320m^3+2416m^2-6975m-7942)}{(2m+2)^6(2m+4)^2(2m+3)} \tag{28}$$

$$b_{4,2} = -\frac{2(2m-1)(4m^3+16m^2+25m+64)}{(2m+2)^4(2m+4)^2(2m+3)} \tag{29}$$

$$a_{4,1} = \frac{12(2m-1)(16m^5+672m^4+3320m^3+2416m^2-6975m-7942)}{(2m+2)^5(2m+4)^2(2m+3)} \tag{30}$$

$$a_{4,2} = -\frac{4(2m-1)(4m^3+16m^2+25m+64)}{(2m+2)^4(2m+4)^2(2m+3)^2} \tag{31}$$

3 Summarize and prove the general formula of superpotential

From the four terms of $W_1 - W_4$, we hypothetically summarize a general formula for W_n as

$$W_n(\theta) = \sum_{k=1}^{[\frac{n}{2}]} a_{n,k} \sin^{2k-1}\theta\cos\theta + \sum_{k=1}^{[\frac{n+1}{2}]} b_{n,k}\sin^{2k-1}\theta \tag{32}$$

Here we use mathematical induction to prove that the guess is true.

First it is easy to see the assumption (32) is the same as that of W_1 when $N = 1$. Under the condition that all W_N meet the requirement of (32) whenever $N \leq n-1$, we will try to solve the differential equation for W_n to verify that it also can be written as that of (32) and be determined by the terms $W_k, k < n$. The results are

$$b_{n,l} = \sum_{p=l+1}^{[\frac{n}{2}]+1} \frac{3(2m+2l-2)j_{n,p}\bar{I}(2m+2p-4,p-l-1)}{(2m+2l+1)(2m+2l+3)(2m+2p-3)} + \frac{g_{n,l}}{2m+2l}\delta_{l,1}, l \geq 1 \tag{33}$$

$$a_{n,l} = -\sum_{p=l+1}^{[\frac{n}{2}]+1} \frac{(2m+2l-2)(2m+2l)j_{n,p}\bar{I}(2m+2p-4,p-l-1)}{(2m+2l+1)(2m+2l+3)(2m+2p-3)}, l \geq 1 \tag{34}$$

where

$$j_{n,p} = \frac{[h_{n,p}(2m+2p)-3g_{n,p}](2m+2p+1)}{(2m+2p-2)(2m+2p)}. \quad (35)$$

The terms $h_{n,p},\ g_{n,p}$ are determined by the coefficients $a_{k,j},\ b_{k,j},\ k<n$ of $W_k,\ k<n$:

$$h_{n,p} = \sum_{k=1}^{n-1}\sum_{j=1}^{p-1}\left[b_{k,p-j}b_{n-k,j}+a_{k,p-j}a_{n-k,j}-a_{k,p-1-j}a_{n-k,j}\right] \quad (36)$$

$$g_{n,p} = \sum_{k=1}^{n-1}\sum_{j=1}^{p-1}\left[b_{k,p-j}a_{n-k,j}+a_{k,p-j}b_{n-k,j}\right] \quad (37)$$

4 The ground eigenfunction

Finally, according to the shape invariant potential,we obtain the wave functions of the exited state Θ_0.

$$W = W_0+\sum_{n=1}^{\infty}\left[\cos\theta\sum_{k=1}^{[\frac{n}{2}]}a_{n,k}\sin^{2k-1}\theta+\sum_{k=1}^{[\frac{n+1}{2}]}b_{n,k}\sin^{2k-1}\theta\right]\beta^n \quad (38)$$

The ground eigenfunction becomes

$$\begin{aligned}\Theta_0 &= N\exp\left[-\int W d\theta\right]\\ &= N\exp\left[-\int W_0 d\theta-\sum_{n=1}^{\infty}\int W_n d\theta\right]\\ &= N\exp\left[\int\frac{3/2+(m+\frac{1}{2})\cos\theta}{sin\theta}d\theta-\beta^n\sum_{n=1}^{\infty}\int(\cos\theta\sum_{k=1}^{[\frac{n}{2}]}a_{n,k}\sin^{2k-1}\theta+\sum_{k=1}^{[\frac{n+1}{2}]}b_{n,k}\sin^{2k-1}\theta)d\theta\right]\\ &= N(1-\cos\theta)^{\frac{3}{2}}\sin^{m-1}\theta\exp\left[-\beta^n\sum_{n=1}^{\infty}\left(\sum_{k=1}^{[\frac{n}{2}]}a_{n,k}\frac{\sin^{2k}\theta}{2k}+\sum_{k=1}^{[\frac{n+1}{2}]}b_{n,k}P(2k-1,\theta)\right)\right] \quad (39)\end{aligned}$$

The ground eigenvalue is

$$E_{0,n;m} = E_{0,0;m}+\sum_{n=1}^{\infty}\beta^n E_{0,n;m} = m^2+m-15/2+\sum_{n=1}^{\infty}\beta^n E_{0,n;m} \quad (40)$$

5 The excited eigenfunctions

In the following, we will compute the excited eigenfunctions. As done in Ref.[11], we hope to extend the study of the recurrence relations by the means of super-symmetric quantum mechanics to Eq. (3).

The super-potential W connects the two partner potential $V_{\mp}$ by

$$V^{\mp}(\theta) = W^2(\theta) \mp W'(\theta). \tag{41}$$

The shape-invariance properties mean that the pair of partner potentials $V^{\pm}(x)$ are similar in shape and differ only in the parameters, that is

$$V^{+}(\theta; a_1) = V^{-}(\theta; a_2) + R(a_1), \tag{42}$$

where a_1 is a set of parameters, a_2 is a function of a_1 (say $a_2 = f(a_1)$) and the remainder $R(a_1)$ is independent of θ.

We must introduce the parameters $A_{i,j},\ B_{i,j}$ into the super-potential W in order to study the shape-invariance properties of the spin-weighted spheroidal equations as:

$$\begin{aligned} W(A_{n,j}, B_{n,j}, \theta) &= -A_{0,0}(m + \frac{1}{2}) \cot\theta - \frac{3}{2} B_{0,0} \csc\theta \\ &\quad + \sum_{n=1}^{\infty} \beta^n W_n(A_{n,j}, B_{n,j}, \theta), \end{aligned} \tag{43}$$

where

$$\begin{aligned} & W_n(A_{n,j}, B_{n,j}, \theta) \\ &= \sum_{j=1}^{[\frac{n+1}{2}]} \bar{b}_{n,j} \sin^{2j-1}\theta + \cos\theta \sum_{j=1}^{[\frac{n}{2}]} \bar{a}_{n,j} \sin^{2j-1}\theta \end{aligned} \tag{44}$$

with

$$\bar{a}_{n,j} = A_{n,j} a_{n,j},\ \bar{b}_{n,j} = B_{n,j} b_{n,j} \tag{45}$$

Then, $V^{\pm}(A_{n,j}, B_{n,j}, \theta)$ are $V^{\pm}(A_{n,j}, B_{n,j}, \theta)$ are defined as

$$\begin{aligned} V^{\pm}(A_{n,j}, B_{n,j}, \theta) &= W^2(A_{n,j}, B_{n,j}, \theta) \pm W' \\ &= \sum_{n=0}^{\infty} \beta^n V_n^{\pm}(A_{i,j}, B_{n,j}, \theta). \end{aligned} \tag{46}$$

The key point is to try to find some quantities $C_{i,j}, D_{i,j}$ to make the relations

$$V_n^{+}(A_{i,j}, B_{n,j}, \theta) = V_n^{-}(C_{i,j}, D_{n,j}, \theta) + R_{n;m}(A_{i,j}, B_{n,j}) \tag{47}$$

retain with $R_{n;m}(A_{i,j}, B_{n,j}) = R_{n;m}$ pure quantities. In the previous , we know the general formula with W_n in the case of $s = 3/2$ is same as $s = 1/2$. So that, we can refer to the results of previous article:

$$D_{n,p} = \frac{D_{0,0} a_{n,p}}{\alpha_p b_{n,p}} C_{n,p} - \frac{U_{n,p}}{\alpha_p b_{n,p}} \tag{48}$$

$$C_{n,p-1} = \frac{\left(\alpha_p + \frac{D_{0,0}^2}{\alpha_p}\right) a_{n,p}}{(\alpha_p - 1) a_{n,p-1}} C_{n,p} + \frac{\check{U}_{n,p} - \frac{D_{0,0}}{\alpha_p} U_{n,p}}{(\alpha_p - 1) a_{n,p-1}}, \tag{49}$$

$$p = 2, 3, \ldots, [\frac{n+2}{2}] \tag{50}$$

where,

$$
\begin{aligned}
U_{n,p} &= -\alpha_p D_{n,p} b_{n,p} - D_{0,0} C_{n,p} a_{n,p} && (51)\\
\check{U}_{n,p} &= -\alpha_p C_{n,p} a_{n,p} - D_{0,0} D_{n,p} b_{n,p} + (\alpha_p - 1) C_{n,p-1} a_{n,p-1} && (52)\\
\alpha_p &= \Big[(2m+1)C_{0,0} + (2p-1)\Big] && (53)
\end{aligned}
$$

The only difference is the initial value. Now, we will give the initial value for the cases $n = 0,\ 1, 2$:

$$
\begin{aligned}
C_{0,0} &= A_{0,0} + \frac{2}{2m+1}, && (54)\\
D_{0,0} &= B_{0,0} && (55)\\
D_{1,1} &= \frac{(2m+1)A_{0,0} - 1}{(2m+1)A_{0,0} + 3} B_{1,1} && (56)
\end{aligned}
$$

and

$$
\begin{aligned}
D_{2,1} &= \frac{(2m+1)A_{0,0} - 1}{(2m+1)A_{0,0} + 3} B_{2,1} \\
&\quad + \frac{18 B_{0,0} B_{2,1}}{[(2m+1)A_{0,0} + 3][(2m+1)A_{0,0} + 4]} \\
&\quad - \frac{24[(2m+1)A_{0,0} + 1] B_{0,0} B_{1,1}^2}{[(2m+1)A_{0,0} + 3]^3 [(2m+1)A_{0,0} + 4]} && (57)\\
C_{2,1} &= \frac{8[(2m+1)A_{0,0} + 1] B_{1,1}^2}{[(2m+1)A_{0,0} + 3]^3 [(2m+1)A_{0,0} + 4]} \\
&\quad + \frac{(2m+1)A_{0,0} - 2}{(2m+1)A_{0,0} + 4} A_{2,1} && (58)
\end{aligned}
$$

with

$$
\begin{aligned}
& R_{0;m}(A_{0,0}) = (2m+1)A_{0,0} + 1, && (59)\\
& R_{1;m}(A_{0,0}, B_{0,0}, B_{1,1}) = -\frac{12 B_{0,0} B_{1,1}}{(2m+1)A_{0,0} + 3} && (60)\\
& R_{2;m}(A_{0,0}, B_{0,0}, B_{1,1}, B_{2,1}, A_{2,1}) \\
&= [-\frac{4 B_{0,0} B_{2,1}}{(2m+1)A_{0,0} + 3} + A B_{1,1}^2 + B A_{2,1}] && (61)
\end{aligned}
$$

where

$$
\begin{aligned}
A &= \frac{72 B_{0,0}^2 - 8[(2m+1)A_{0,0} - 1][(2m+1)A_{0,0} + 3]}{[(2m+1)A_{0,0} + 3]^3 [(2m+1)A_{0,0} + 4]} \\
B &= \frac{54 B_{0,0}^2 - 2[(2m+1)A_{0,0} - 1][(2m+1)A_{0,0} + 3]}{[(2m+1)A_{0,0} + 3][(2m+1)A_{0,0} + 4]} && (62)
\end{aligned}
$$

Then, the excited eigen-values $E_{l;m}$ and eigenfunctions Ψ_l is obtained by the recurrence relation :

$$E^{-}_{l;m} = E_{0;m} + \sum_{k=1}^{l} R(a_k, b_k), \tag{63}$$

$$E_{0;m} = m(m+1) - \frac{15}{2} + \sum_{n=1}^{\infty} E_{0,n;m}\beta^n \tag{64}$$

$$R(a_k, b_k) = R_{0;m} + \sum_{n=1}^{\infty} \beta^n R_{n;m}(a_k, b_k), \tag{65}$$

$$a_1 = (A_{i,j}, B_{i,j}),\ a_2 = (C_{i,j}, D_{i,j}), \ldots, \tag{66}$$

$$\Psi_0 \propto \exp\Big[- \int_{\theta_0}^{\theta} W(A_{n,j}, B_{n,j}, \theta) d\theta \Big], \tag{67}$$

$$\mathcal{A}^{\dagger} = -\frac{d}{d\theta} + W(A_{n,j}, B_{n,j}, \theta) \tag{68}$$

$$\Psi^{-}_{n} = \mathcal{A}^{\dagger}(A_{n,j}, B_{n,j}, \theta)\Psi^{-}_{n-1}(C_{n,j}, D_{n,j}, \theta), \tag{69}$$

$$n = 1, 2, 3, \ldots \tag{70}$$

In conclusion, we have proved the shape-invariance properties for the spin-weighted equations in the case of $s = \frac{3}{2}$ and obtain the recurrence relations for them. By these results we can get the exited eigenvalue and eigenfunction.

6 The details of the calculation of the first several terms of the superpotential

In order to calculate Eqs.(14)-(15), we needs the following integral formulae [13]:

$$P(2m, \theta) = \int sin^{2m}\theta d\theta = -\frac{\cot\theta}{2m+1}\left[\sum_{k=0}^{m-1} \bar{I}(2m, k) sin^{2m-2k}\theta\right] + \frac{(2m-1)!!}{(2m)!!} \tag{71}$$

where

$$\bar{I}(2m, k) = \frac{(2m+1)(2m-1)\cdots(2m-2k+1)}{2m(2m-2)\cdots(2m-2k)}, (k \geq 0), \tag{72}$$

the repeating results of the above equation

$$P(2m, \theta) \ = \ \frac{2m-1}{2m} P(2m-2, \theta) - \frac{\cos\theta \sin^{2m-1}\theta}{2m}, \tag{73}$$

$$
\begin{aligned}
P(2m+2,\theta) &= \frac{(2m-1)(2m+1)}{2m(2m+2)}P(2m-2,\theta) \\
&\quad -\frac{\cos\theta\sin^{2m+1}}{2m+2} - \frac{(2m+1)\cos\theta\sin^{2m-1}\theta}{2m(2m+2)} \\
P(2m+4,\theta) &= \frac{(2m-1)(2m+1)(2m+3)}{2m(2m+2)(2m-4)}P(2m-2,\theta) - \frac{\cos\theta\sin^{2m+3}}{2m+4} \\
&\quad -\frac{(2m+3)\cos\theta\sin^{2m+1}\theta}{(2m+2)(2m+4)} - \frac{(2m+1)(2m+3)\cos\theta\sin^{2m-1}\theta}{2m(2m+2)(2m-4)} \qquad (74)
\end{aligned}
$$

By the above equation,we can summarize the general formula

$$
\begin{aligned}
P(2m+2n-2) &= -\cos\theta\sum_{l=1}^{n}\frac{\bar{I}(2m+2n-2,n-l)}{2m+2n-1}\sin^{2m+2l-3}\theta \\
&\quad +\frac{2m-1}{2m+2n-1}\bar{I}(2m+2n-2,n-1)P(2m-2,\theta) \qquad (75)
\end{aligned}
$$

This formula can be proved by mathematical induction. By the help of Eqs.(13), (75), $A_1(\theta)$ is now simplified as

$$
\begin{aligned}
& A_1(\theta) \\
= & \int (E_{0,1;m} - 3cos\theta)(1-cos\theta)^3 sin^{2m-2}\theta d\theta \\
= & (4E_{0,1;m}+12)P(2m-2,\theta) - (3E_{0,1;m}+15)P(2m,\theta) + 3P(2m+2,\theta) \\
& -\frac{4E_{0,1;m}+12)sin^{2m-1}\theta}{2m-1} - \frac{(9+E_{0,1;m})sin^{2m+1}\theta}{2m+1} \\
= & [4E_{0,1;m}+12-(3E_{0,1;m}+15)\frac{2m-1}{2m} + \frac{3(2m-1)(2m+1)}{2m(2m+2)}]P(2m-2,\theta) \\
& -\frac{4(E_{0,1;m}+12)sin^{2m-1}\theta}{2m-1} - \frac{(9+E_{0,1;m})sin^{2m+1}\theta}{2m+1} \\
& -\frac{3\cos\theta\sin^{2m+1}}{2m+2} + \frac{[(2m+2)(3E_{0,1;m}+15)-(2m+1)]\cos\theta\sin^{2m-1}\theta}{2m(2m+2)} \qquad (76)
\end{aligned}
$$

Please note that the coefficient of $P(2m-2,\theta)$,According to Eq.(5) and Eq.(71), we can see that $\Psi(\theta)$ is ∞ at the boundaries $\theta = 0,\ \pi$. This result does not meet the boundary conditions that $\Psi(\theta)$ should finite at $\theta = 0,\ \pi$. So that the coefficient of the term $P(2m-2,\theta)$ should be zero.

$$
E_{0,1;m} = -\frac{9}{2m+2} \qquad (77)
$$

and it further provides the concise form for A_1

$$
\begin{aligned}
A_1(\theta) &= -\frac{12}{2m+2}\sin^{2m-1}\theta(\cos\theta-1) \\
&\quad +\frac{3}{2m+2}\sin^{2m+1}\theta(1-\cos\theta) + \frac{3}{2m+2}\sin^{2m+1} \qquad (78)
\end{aligned}
$$

With the help of Eq.(14), it is easy to obtain the first order $W_1(\theta)$

$$W_1(\theta) \;=\; A_1(\theta)(1+cos\theta)^3(sin\theta)^{-2m-4} = -\frac{3}{2m+2}\sin\theta \tag{79}$$

Now, we can see $W_1(\theta)$ is convergence at the boundaries $\theta = 0,\ \pi$. So that, the result of $E_{0,1;m}$ is appropriate. By the same steps with more complex calculation than $W_1(\theta)$, we can also get $E_{0,2;m}$, W_2 $E_{0,3;m}$, W_3 and $E_{0,4;m}$, W_4 .

7 the calculation for the general form of W_n

Back to Eqs.(12),(14),(15), one needs to simplify the term $\sum_{k=1}^{n-1} W_k W_{n-k}$ in order to calculate W_n. Whenever $1 \le k \le n-1$, one has $1 \le n-k \le n-1$ and $W_k(\theta)$, $W_{n-k}(\theta)$ could be written in the form of (32). That is,

$$\begin{aligned} W_k(\theta) &= \sum_{i=1}^{[\frac{k}{2}]} a_{k,i}\sin^{2i-1}\theta\cos\theta + \sum_{i=1}^{[\frac{k+1}{2}]} b_{k,i}\sin^{2i-1}\theta \\ W_{n-k}(\theta) &= \sum_{j=1}^{[\frac{n-k}{2}]} a_{n-k,j}\sin^{2j-1}\theta\cos\theta + \sum_{j=1}^{[\frac{n-k+1}{2}]} b_{n-k,j}\sin^{2j-1}\theta \end{aligned} \tag{80}$$

For the sake of later use, the facts are true

$$a_{i,j} = 0, j < 1 \ or\ j > [\frac{i}{2}];\quad b_{i,j} = 0,\ j < 1 \ or\ j > [\frac{i+1}{2}] \tag{81}$$

for $i < n$. Thus

$$\begin{aligned} &\sum_{k=1}^{n-1} W_k W_{n-k} \\ =\ & \sum_{k=1}^{n-1}\sum_{i=1}^{[\frac{k+1}{2}]}\sum_{j=1}^{[\frac{n-k+1}{2}]} b_{k,i}b_{n-k,j}\sin^{2i+2j-2}\theta + \sum_{k=1}^{n-1}\sum_{i=1}^{[\frac{k}{2}]}\sum_{j=1}^{[\frac{n-k}{2}]} a_{k,i}b_{n-k,j}\sin^{2i+2j-2}\theta\cos^2\theta \\ &+\cos\theta\sum_{k=1}^{n-1}\Big[\sum_{i=1}^{[\frac{k}{2}]}\sum_{j=1}^{[\frac{n-k+1}{2}]} a_{k,i}b_{n-k,j}\sin^{2i+2j-2}\theta + \sum_{i=1}^{[\frac{k+1}{2}]}\sum_{j=1}^{[\frac{n-k}{2}]} b_{k,i}a_{n-k,j}\sin^{2i+2j-2}\theta\Big] \\ =\ & \sum_{p=2}^{\bar{c}_1}\sum_{k=1}^{n-1}\sum_{j=1}^{p-1} b_{k,p-j}b_{n-k,j}sin^{2p-2}\theta + \sum_{p=2}^{\bar{c}_2}\sum_{k=1}^{n-1}\sum_{j=1}^{p-1} a_{k,p-j}a_{n-k,j}sin^{2p-2}\theta\cos^2\theta \\ &+\cos\theta\Big[\sum_{p=2}^{\bar{c}_3}\sum_{k=1}^{n-1}\sum_{j=1}^{p-1} b_{k,p-j}a_{n-k,j}sin^{2p+1}\theta + \sum_{p=2}^{\bar{c}_4}\sum_{k=1}^{n-1}\sum_{j=1}^{p-1} a_{k,p-j}b_{n-k,j}sin^{2p+1}\theta\Big] \\ =\ & \sum_{p=2}^{[\frac{n}{2}]+1}\Big[h_{n,p} + g_{n,p}\cos\theta\Big]sin^{2p-2}\theta \end{aligned} \tag{82}$$

$$\tag{83}$$

where $g_{n,p}$ and $h_{n,p}$ are constant coefficients:

$$h_{n,p} = \sum_{k=1}^{n-1}\sum_{j=1}^{p-1}\Big[b_{k,p-j}b_{n-k,j} + a_{k,p-j}a_{n-k,j} - a_{k,p-1-j}a_{n-k,j}\Big] \quad (84)$$

$$g_{n,p} = \sum_{k=1}^{n-1}\sum_{j=1}^{p-1}\Big[b_{k,p-j}a_{n-k,j} + a_{k,p-j}b_{n-k,j}\Big] \quad (85)$$

$$\bar{c}_1 = \left[\frac{k+1}{2}\right] + \left[\frac{n-k+1}{2}\right],\ \bar{c}_2 = \left[\frac{k}{2}\right] + \left[\frac{n-k}{2}\right] \quad (86)$$

$$\bar{c}_3 = \left[\frac{k+1}{2}\right] + \left[\frac{n-k}{2}\right],\ \bar{c}_4 = \left[\frac{k}{2}\right] + \left[\frac{n-k+1}{2}\right] \quad (87)$$

It is easy to see

$$\bar{c}_1 = \frac{n}{2}+1,\ \ \bar{c}_2 = \bar{c}_3 = \bar{c}_4 = \frac{n}{2},\ when\ n\ is\ even \quad (88)$$

$$\bar{c}_2 = \frac{n-1}{2},\ \ \bar{c}_1 = \bar{c}_3 = \bar{c}_4 = \frac{n+1}{2},\ \ when\ n\ is\ odd \quad (89)$$

Hence, one has

$$\begin{aligned} g_{n,p} &= 0,\ \ p<1\ or p>\frac{n}{2};\ \ h_{n,p}=0,\ \ p<1\ or\ p>\frac{n}{2}+1,\ when\ n\ is\ even \\ g_{n,p} &= h_{n,p}=0,\ \ p<1\ or\ p>\frac{n+1}{2},\ \ when\ n\ is\ odd. \end{aligned} \quad (90)$$

We have used the fact (81) and substituted the quantities $\bar{c}_1,\ \bar{c}_2,\ \bar{c}_3,\ \bar{c}_4$ by the maximum $\left[\frac{n}{2}\right]+1$ of them in last line in the above equation. Taking $f_n(z) = E_{0,n;m} + \sum_{k=1}^{n-1} W_k W_{n-k}$ into Eqs.(15) we can have

$$\begin{aligned} & A_n(\theta) \\ = & \int [E_{0,n;m} + \sum_{p=2}^{\left[\frac{n}{2}\right]+1}\Big[h_{n,p} + g_{n,p}\cos\theta\Big] sin^{2p-2}\theta](1-cos\theta)^3 sin^{2m-2}\theta d\theta \\ = & \int 4E_{0,n;m}\sin^{2m-2}\theta d\theta - \int 3E_{0,n;m}\sin^{2m}\theta d\theta \\ & -\frac{4E_{0,n;m}}{2m-1}\sin^{2m-1}\theta + \frac{E_{0,n;m}}{2m+1}\sin^{2m+1}\theta \\ & + \sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{4g_{n,p}-4h_{n,p}}{2m+2p-3} sin^{2m+2p-3}\theta + \sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{h_{n,p}-3g_{n,p}}{2m+2p-1} sin^{2m+2p-1}\theta \\ & + \sum_{p=2}^{\left[\frac{n}{2}\right]+1}\int (4h_{n,p}-4g_{n,p}) sin^{2m+2p-4}\theta d\theta \end{aligned}$$

$$
\begin{aligned}
&+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\int(5g_{n,p}-3h_{n,p})sin^{2m+2p-2}\theta d\theta-\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\int g_{n,p}sin^{2m+2p}\theta d\theta\\
=\;& 4E_{0,n;m}P(2m-2,\theta)-3E_{0,n;m}P(2m,\theta)-\frac{4E_{0,n;m}}{2m-1}\sin^{2m-1}\theta+\frac{E_{0,n;m}}{2m+1}\sin^{2m+1}\theta\\
&+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{4g_{n,p}-4h_{n,p}}{2m+2p-3}sin^{2m+2p-3}\theta+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{h_{n,p}-3g_{n,p}}{2m+2p-1}sin^{2m+2p-1}\theta\\
&+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}(4h_{n,p}-4g_{n,p})P(2m+2p-4,\theta)\\
&+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}(5g_{n,p}-3h_{n,p})P(2m+2p-2,\theta)-\sum_{p=2}^{\left[\frac{n}{2}\right]+1}g_{n,p}P(2m+2p,\theta)\\
=\;& 4E_{0,n;m}P(2m-2,\theta)-3E_{0,n;m}P(2m,\theta)-\frac{4E_{0,n;m}}{2m-1}\sin^{2m-1}\theta+\frac{E_{0,n;m}}{2m+1}\sin^{2m+1}\theta\\
&+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{4g_{n,p}-4h_{n,p}}{2m+2p-3}sin^{2m+2p-3}\theta+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{h_{n,p}-3g_{n,p}}{2m+2p-1}sin^{2m+2p-1}\theta\\
&-\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\left[\frac{5g_{n,p}-3h_{n,p}}{2m+2p-2}+\frac{(2m+2p-1)g_{n,p}}{(2m+2p-2)(2m+2p)}\right]sin^{2m+2p-3}\theta\cos\theta\\
&+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{g_{n,p}}{2m+2p}sin^{2m+2p-1}\theta\cos\theta\\
&+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}j_{n,p}P(2m+2p-4,\theta)\\
=\;& 4E_{0,n;m}P(2m-2,\theta)-3E_{0,n;m}P(2m,\theta)-\frac{4E_{0,n;m}}{2m-1}\sin^{2m-1}\theta+\frac{E_{0,n;m}}{2m+1}\sin^{2m+1}\theta\\
&+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{4g_{n,p}-4h_{n,p}}{2m+2p-3}sin^{2m+2p-3}\theta+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{h_{n,p}-3g_{n,p}}{2m+2p-1}sin^{2m+2p-1}\theta\\
&-\sum_{p=2}^{\left[\frac{n}{2}\right]+1}i_{n,p}sin^{2m+2p-3}\theta\cos\theta+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}\frac{g_{n,p}}{2m+2p}sin^{2m+2p-1}\theta\cos\theta\\
&+\sum_{p=2}^{\left[\frac{n}{2}\right]+1}j_{n,p}P(2m+2p-4,\theta) \qquad (91)
\end{aligned}
$$

Where $i_{n,p}$ and $j_{n,p}$ are constant coefficients:

$$i_{n,p} = \left[\frac{5g_{n,p} - 3h_{n,p}}{2m+2p-2} + \frac{(2m+2p-1)g_{n,p}}{(2m+2p-2)(2m+2p)}\right] \tag{92}$$

$$\begin{aligned} j_{n,p} &= 4(h_{n,p} - g_{n,p}) + \frac{2m+2p-3}{2m+2p-2}[5g_{n,p} - 3h_{n,p}] \\ &\quad -\frac{(2m+2p-3)(2m+2p-1)}{(2m+2p)(2m+2p-2)}g_{n,p} \\ &= 4(h_{n,p} - g_{n,p}) + (2m+2p-3)i_{n,p} \qquad (93) \\ &= \frac{[h_{n,p}(2m+2p) - 3g_{n,p}](2m+2p+1)}{(2m+2p-2)(2m+2p)} \qquad (94) \end{aligned}$$

According to Eq.(75), one has

$$\begin{aligned} P(2m+2p-4) &= -\cos\theta \sum_{l=1}^{p-1} \frac{\bar{I}(2m+2p-4, p-l-1)}{2m+2p-3} \sin^{2m+2l-3}\theta \\ &\quad + \frac{2m-1}{2m+2p-3}\bar{I}(2m+2p-4, p-2)P(2m-2,\theta) \qquad (95) \end{aligned}$$

Hence,

$$\begin{aligned} & A_n(\theta) \\ = \; & 4E_{0,n;m}P(2m-2,\theta) + 3E_{0,n;m}[\frac{cos\theta sin^{2m-1}\theta}{2m} - \frac{2m-1}{2m}P(2m-2,\theta)] \\ & -\frac{4E_{0,n;m}}{2m-1}\sin^{2m-1}\theta + \frac{E_{0,n;m}}{2m+1}\sin^{2m+1}\theta \\ & + \sum_{p=2}^{[\frac{n}{2}]+1} \frac{4g_{n,p} - 4h_{n,p}}{2m+2p-3} sin^{2m+2p-3}\theta + \sum_{p=2}^{[\frac{n}{2}]+1} \frac{h_{n,p} - 3g_{n,p}}{2m+2p-1} sin^{2m+2p-1}\theta \\ & - \sum_{p=2}^{[\frac{n}{2}]+1} i_{n,p} sin^{2m+2p-3}\theta\cos\theta + \sum_{p=2}^{[\frac{n}{2}]+1} \frac{g_{n,p}}{2m+2p} sin^{2m+2p-1}\theta\cos\theta \\ & + \sum_{p=2}^{[\frac{n}{2}]+1} j_{n,p}[-\cos\theta \sum_{l=1}^{p-1} \frac{\bar{I}(2m+2p-4, p-l-1)}{2m+2p-3}\sin^{2m+2l-3}\theta \\ & + \frac{2m-1}{2m+2p-3}\bar{I}(2m+2p-4, p-2)P(2m-2,\theta)] \qquad (96) \end{aligned}$$

For the coefficient of divergent term must be zero, that is

$$b_1 = \frac{(2m+3)}{2m}E_{0,n;m} + \sum_{p=2}^{[\frac{n}{2}]+1} j_{n,p}\frac{2m-1}{2m+2p-3}\bar{I}(2m+2p-4, p-2) = 0 \qquad (97)$$

then

$$\begin{aligned} & E_{0,n;m} \\ = & -\frac{2m}{2m+3}\sum_{p=2}^{[\frac{n}{2}]+1} j_{n,p}\frac{2m-1}{2m+2p-3}\bar{I}(2m+2p-4,p-2) \\ = & -\sum_{p=2}^{[\frac{n}{2}]+1}\frac{2m(2m-1)[h_{n,p}(2m+2p)-3g_{n,p}](2m+2p+1)}{(2m+3)(2m+2p-3)(2m+2p-2)(2m+2p)}\bar{I}(2m+2p-4,p-2) \end{aligned} \tag{98}$$

Taking Eq.(98) into Eq.(**??**),we can get

$$\begin{aligned} & A_n(\theta) \\ = & -\frac{4E_{0,n;m}}{2m-1}\sin^{2m-1}\theta + \frac{E_{0,n;m}}{2m+1}\sin^{2m+1}\theta + \frac{3E_{0,n;m}}{2m}sin^{2m-1}\theta cos\theta \\ & + \sum_{p=2}^{[\frac{n}{2}]+1}\frac{4g_{n,p}-4h_{n,p}}{2m+2p-3}sin^{2m+2p-3}\theta + \sum_{p=2}^{[\frac{n}{2}]+1}\frac{h_{n,p}-3g_{n,p}}{2m+2p-1}sin^{2m+2p-1}\theta \\ & - \sum_{p=2}^{[\frac{n}{2}]+1} i_{n,p}sin^{2m+2p-3}\theta\cos\theta + \sum_{p=2}^{[\frac{n}{2}]+1}\frac{g_{n,p}}{2m+2p}sin^{2m+2p-1}\theta\cos\theta \\ & - \sum_{p=l+1}^{[\frac{n}{2}]+1} j_{n,p}\cos\theta\sum_{l=1}^{p-1}\frac{\bar{I}(2m+2p-4,p-l-1)}{2m+2p-3}\sin^{2m+2l-3}\theta \end{aligned} \tag{99}$$

It is easy to see the factor $(1-\cos\theta)^3$ in the integrand in above calculation make the form of $A_n(\theta)$ very complicated. More calculation are need to treat the problem now. The results are

$$W_n(\theta) = \cos\theta\sum_{l=1}^{[\frac{n}{2}]} a_{n,l}sin^{2l-1}\theta + \sum_{l=1}^{[\frac{n+1}{2}]} b_{n,l}sin^{2l-1}\theta \tag{100}$$

$$\begin{aligned} & b_{n,l} \\ = & \sum_{p=l+1}^{[\frac{n}{2}]+1}\frac{3(2m+2l-2)j_{n,p}\bar{I}(2m+2p-4,p-l-1)}{(2m+2l+1)(2m+2l+3)(2m+2p-3)} + \frac{g_{n,l}}{2m+2l}\xi_{l,1}, l\geq 1 \end{aligned} \tag{101}$$

$$\begin{aligned} & a_{n,l} \\ = & -\sum_{p=l+1}^{[\frac{n}{2}]+1}\frac{(2m+2l-2)(2m+2l)j_{n,p}\bar{I}(2m+2p-4,p-l-1)}{(2m+2l+1)(2m+2l+3)(2m+2p-3)}, l\geq 1 \end{aligned} \tag{102}$$

where $\xi_{l,1} = 0$, $l = 1$ and otherwise $\xi_{l,1} = 1$, $l \neq 1$. We delay the process of proved in the appendix-1. Therefore, we have proved the correctness of our induction about the general formula with W_n.That is to say, any $n \geq 1$, W_n satisfy the form of general formula. Interestingly, the general formula with W_n in the case of $s = 3/2$ is same as $s = 1/2$.
